

ABSTRACT

A monitor includes a display panel, a displaying circuit,
a connector and a self testing circuit. The self testing
5 circuit has a testing signal generator, a switch circuit and
a detecting circuit. When the detecting circuit detects the
video signals transmitted from the computer, the detecting
circuit switches off the switch circuit so as to avoid the
testing signal generated from the testing signal generator
10 being transmitted to the input port of the displaying circuit.
When no video signals transmitted from the computer are
detected, the detecting circuit switches on the switch circuit
to allow the testing signal generated from the testing signal
generator to be transmitted to the displaying circuit.
